## Geometry Vocabulary

| point <br> An exact location or position. <br> (ex. on a number line or coordinate grid) | line <br> A straight path that extends in both directions without stopping | line segment <br> A piece/part of a line that has two endpoints. |
| :---: | :---: | :---: |
|  |  | $\bigcirc \longrightarrow$ |
| ray <br> A line with one end point and it extends non-stop in the opposite direction. | angle <br> A shape that is formed by two rays that share an endpoint. | vertex <br> The point where two or more line segments (or rays) meet. |
|  |  |  |
| acute angle <br> An angle that measures less than $90^{\circ}$. | obtuse angle <br> An angle that measures more than $90^{\circ}$. | right angle <br> An angle that measures exactly $90^{\circ}$. |
|  |  |  |
| straight angle <br> An angle that measures exactly $180^{\circ}$. | parallel lines <br> Lines that run the same distance apart at all points and will never intersect. | perpendicular lines <br> A special type of intersecting lines that form a $90^{\circ}$ angle. |
|  |  |  |
| intersecting lines two or more lines that meet or cross at a point. | area <br> The number of square units needed to cover the surface of a 2-dimensional shape/figure. | perimeter <br> The total distance around the outside of a shape or area. |
|  |  |  |

| Classifying Quadrilaterals |  |  |  |
| :---: | :---: | :---: | :---: |
| square | $\square$ | - 4 equal sides <br> - 2 pairs of parallel sides - parallelogram <br> - all $90^{\circ}$ | 4-90 ${ }^{\circ}$ angles |
| rectangle |  | - 4 sides <br> - opposite sides are equal <br> - 2 pairs of parallel sides - parallelogram <br> - all $90^{\circ}$ <br> - a square can be a rectangle, but a rectangle cannot be a square | 4-90 ${ }^{\circ}$ angles |
| parallelogram |  | - 4 sides <br> - 2 pairs of parallel sides <br> - opposite sides are equal | 4 angles |
| rhombus |  | - 4 equal sides <br> - opposite sides are equal <br> - 2 pairs of parallel sides - parallelogram | 4 angles |
| trapezoid |  | - 4 sides <br> - only 1 pair of parallel sides | 4 angles |

A quadrilateral is any polygon that has 4 sides. There are many kinds of quadrilaterals, including:

trapezoid
a quadrilateral with exactly 1 pair of parallel sides

parallelogram
a quadrilateral with 2 pairs of parallel sides opposite each other

rectangle a parallelogram with 4 right angles

rhombus
a parallelogram with 4 congruent sides

square a parallelogram with 4 congruent sides and 4 right angles

| $360 \div 4=90$ |
| :---: |
|  |
| each quadrant is equal to $96 \div 4=9$ |
| $9^{\circ}$ |

tricycle has 3
wheels
tri-

hex and six both have has an " $x$ " hex-

quad runner has 4 wheels
quad-

an octopus has 8 tentacles

a pen or a pencil is in your hand that has 5 fingers. pent-
 a decade is a period of 10 years
deca-

| Prefix | Meaning | Word |
| :---: | :---: | :---: |
| uni- | 1 | not a polygon |
| bi- | 2 | not a polygon |
| tri- | 3 | triangle |
| quad- | 4 | quadrilateral |
| pent- | 5 | pentagon |
| hex- | 6 | hexagon |
| hept- | 7 | heptagon |
| oct- | 8 | octagon |
| non- | 9 | nonagon |
| deca- | 10 | decagon |
